Galactic and Extragalactic Chemistry with SPICA

Izaskun Jimenez-Serra
(STFC ERF fellow)

&

Serena Viti
(University College London)

Unique Science with SPICA:

- Dust life cycle:
 - Organic chemistry: PAHs (not revisited since ISO!)
 - ISM Physics: Dust (Ward-Thompson's talk)
 - Ice composition (Helen Fraser's talk)
- Spectroscopy: hydrides!!!
 - HD, H₂O, H₂, OH, NH, NH₂
- C(+), N and O probe:
 - gas physical conditions (density, temperature, UV field)
 - turbulence (kinematics of the PDR layer)

HD (@112 μ m): best gas mass tracer

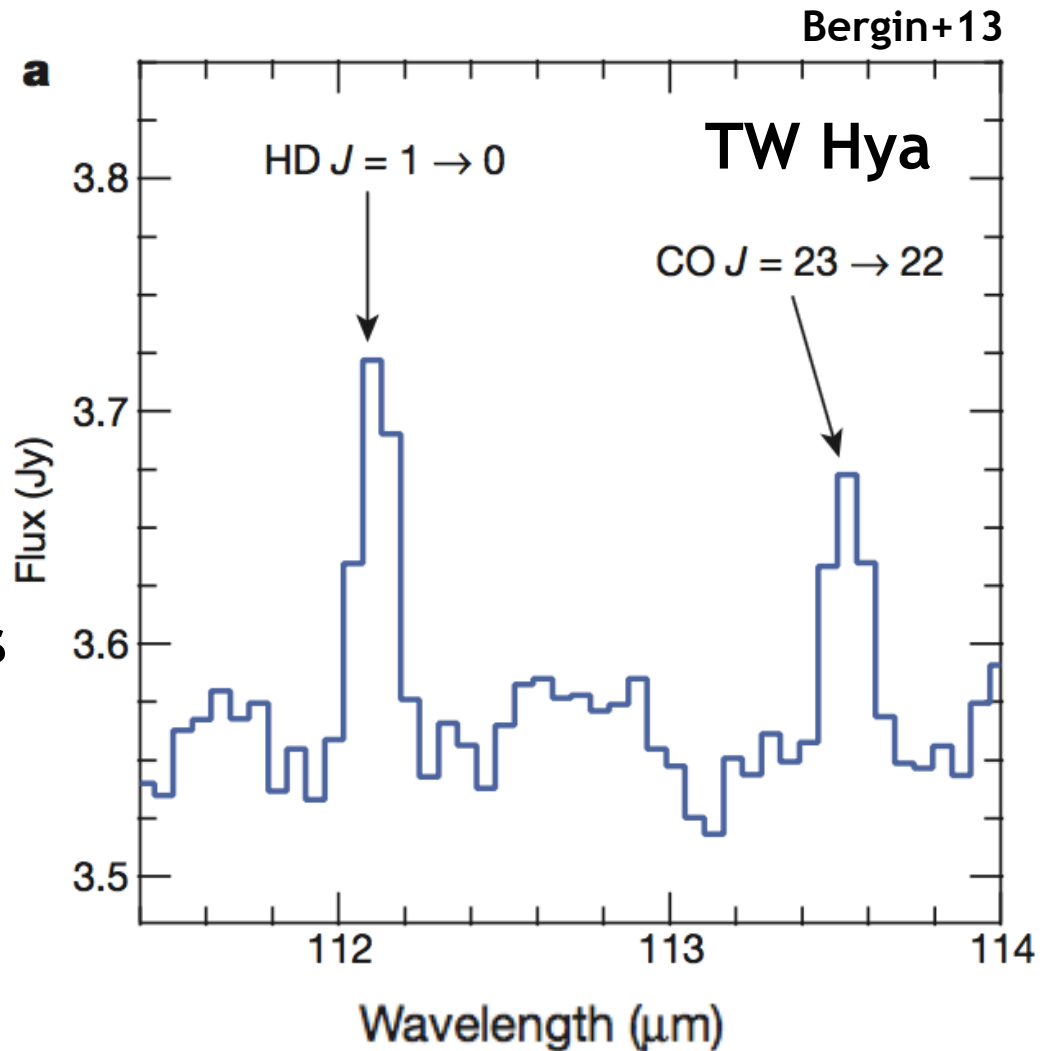

Circumstellar disks

HD follows H₂
HD sensitive to gas mass

$$M_{\text{gas}} \sim 0.05 M_{\odot}$$

(vs. $5 \times 10^{-4} M_{\odot}$ inferred
from CO!!)

H₂O (@180μm): our origins

Pre-stellar Cores (PSCs)

Circumstellar disks

TW Hya

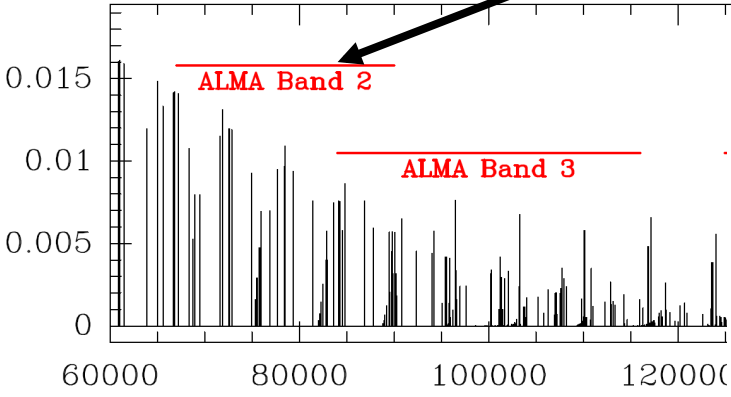

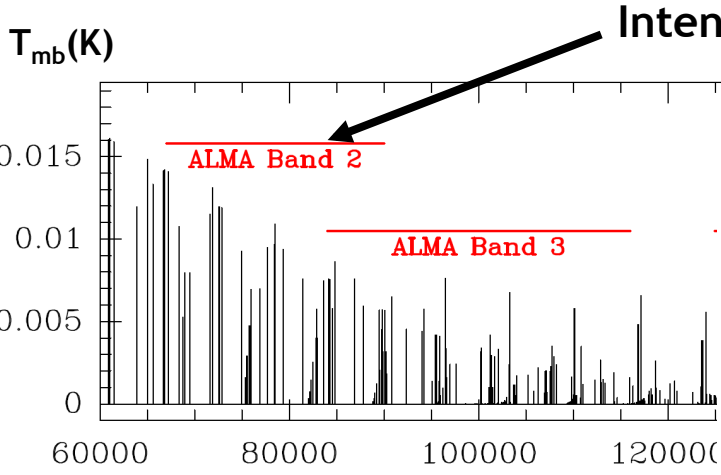

0.005
Earth
Oceans!!

Cold H₂O detected only in 1 PSC and a few disks!!

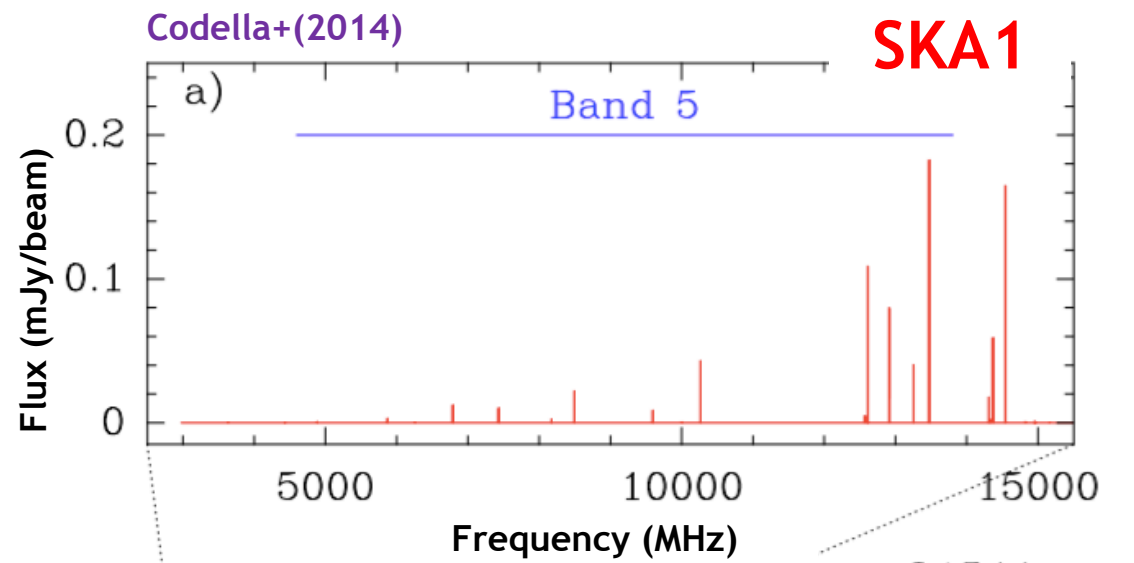

$T_{mb}(K)$ Intensities > 10 mK!!!

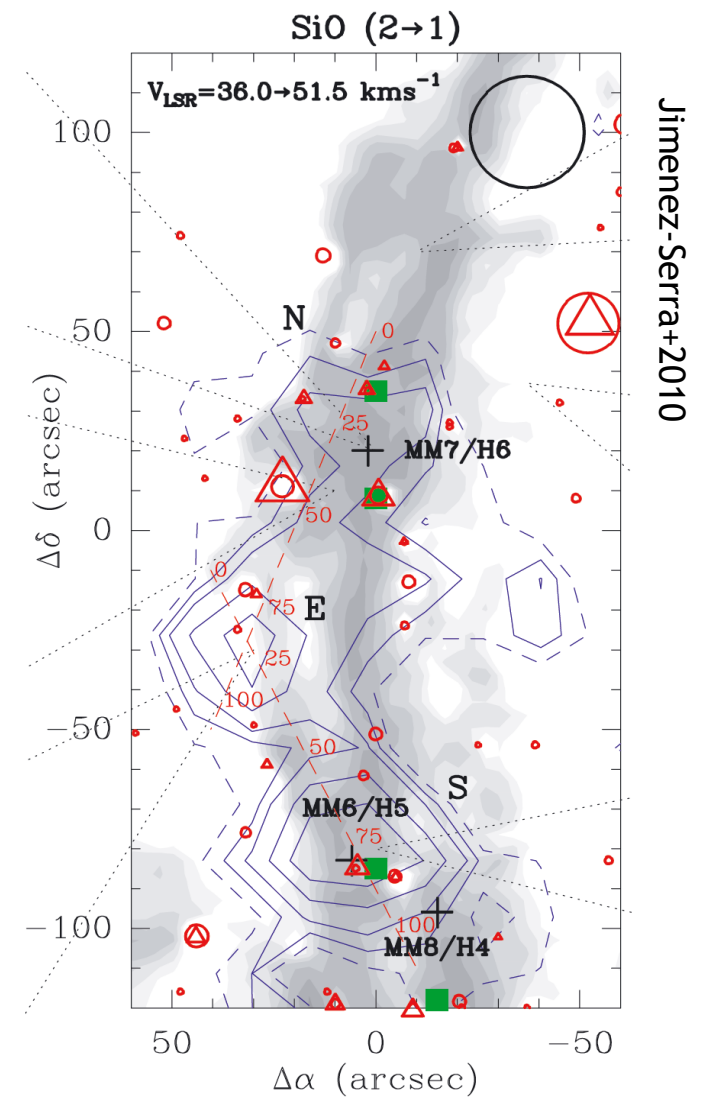

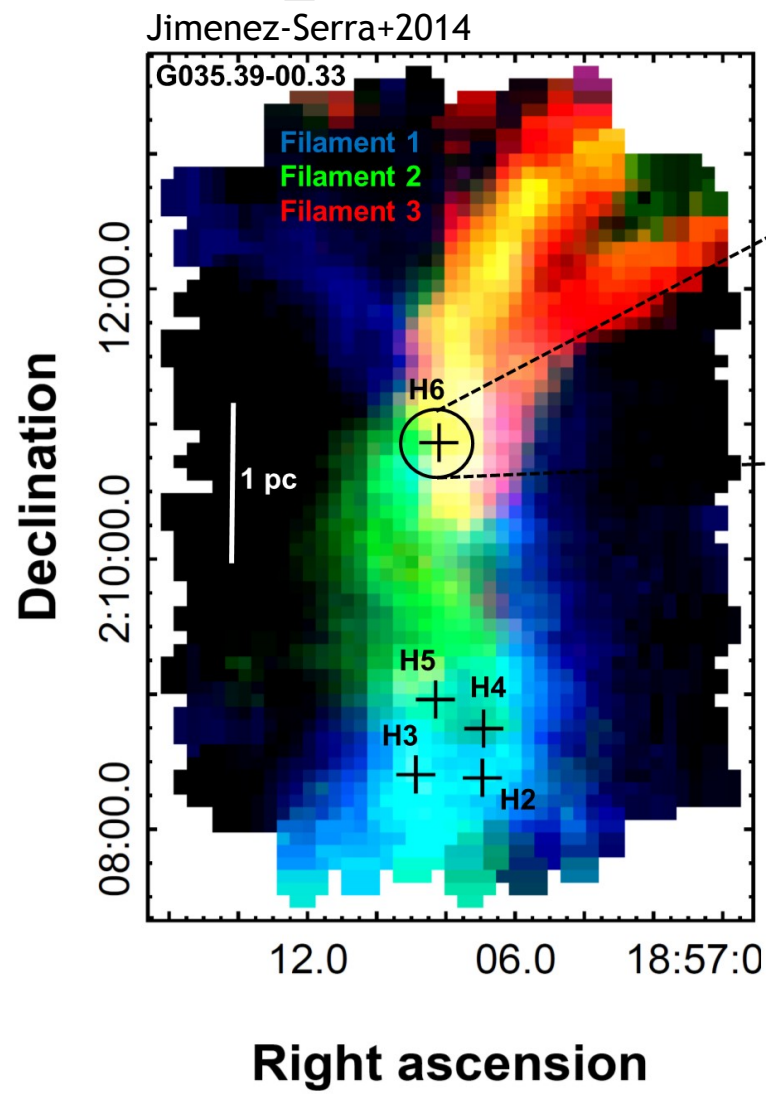

**SPICA can probe
the ice COM
composition in the
THz regime!!!**

H₂O(@180μm) in IRDCs??

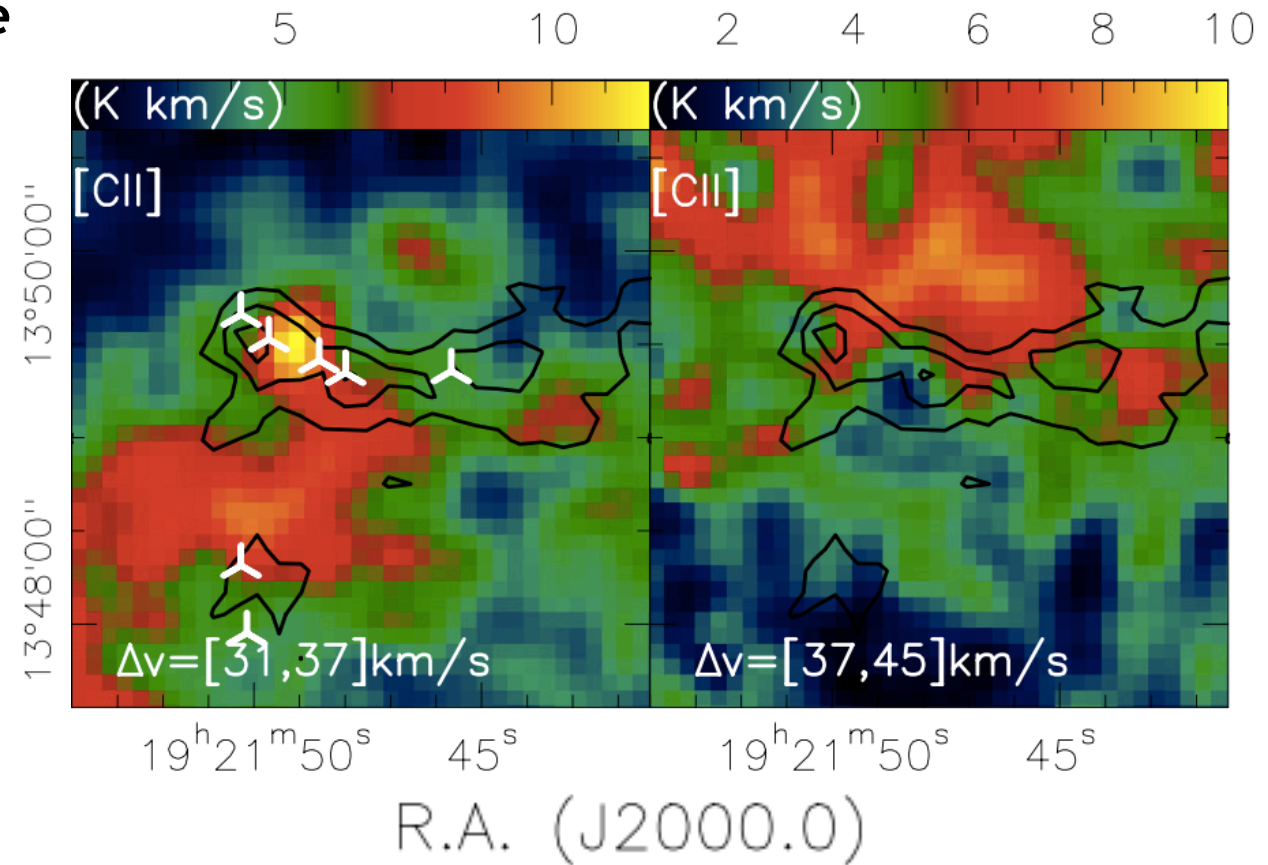

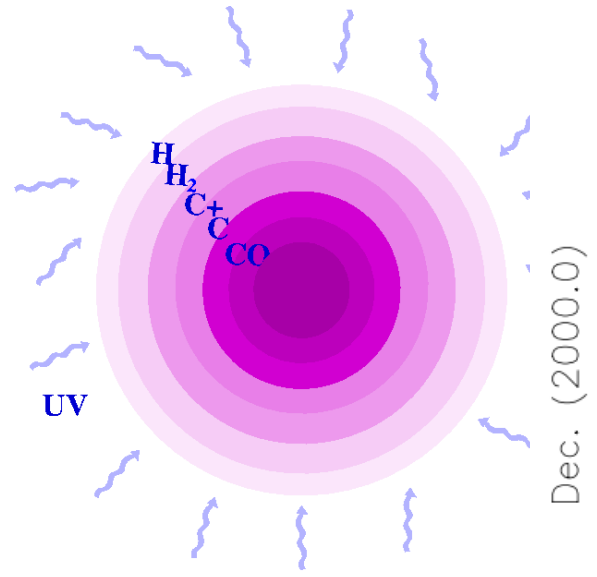

Cold H₂O as probe of cloud-cloud collisions

C⁺ (@158μm): diffuse gas in IRDCs

Beuther+2014

Canonical PDR structure

C⁺ probes turbulence and kinematics of gas in IRDC environment

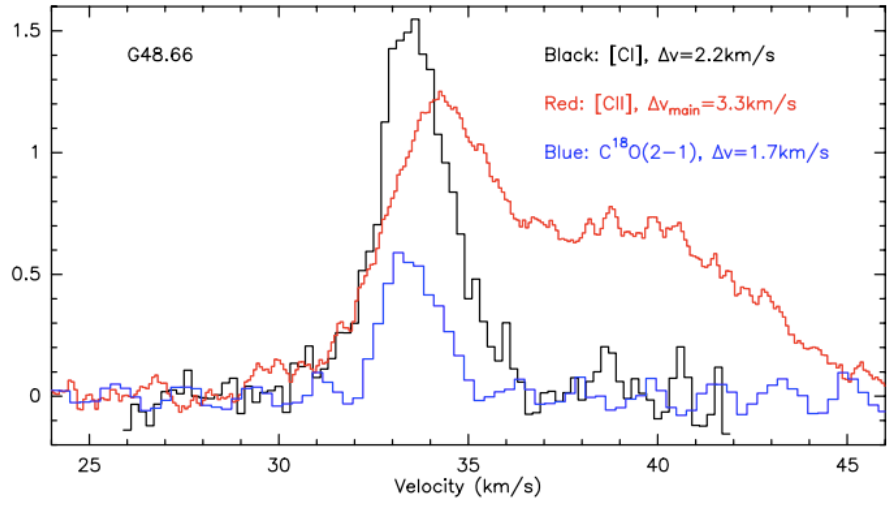

C⁺ (@158μm): diffuse gas in IRDCs

Beuther+2014

Canonical PDR structure

R.A. (J2000.0)

C⁺ probes turbulence and kinematics of gas in IRDC environment

Diffuse PDR gas diagnostics

H/H₂/C⁺/C/CO transitions vary in A_v depending on metallicity, density, UV field, and cosmic ray ionization rate!!!

Diffuse PDR gas diagnostics

- **O**: present in both atomic and molecular gas
65 μm /145 μm transitions diagnostic of optical depth
- **CII**: a true tracer of the PDR zone if HII contribution small
($<30\%$ - Vasta et al. 2010)
- **OI/CII**: diagnostics of temperature, density, UV radiation field
- **O** \rightarrow **OH** \rightarrow **H₂O**: study of the PDR transition from atomic to molecular gas by using the oxygen budget

Potential Project:

Comprehensive study of the 3D distribution of atomic/molecular gas in nearby galaxies to trace the transition from atomic to molecular gas

Motivation:

High spectral resolution observations toward single positions in a few tracers & high spatial maps in other tracers → lack of consistent ‘ensemble’ of data

Comprehensive study to determine the density and temperature structure of a galaxy

What we could address:

With 3D surveys of key transitions of OI, CII, OH and H₂O we could get the average gas contained within each component (HII, PDR, neutral) for *each* type of galaxy → **how do the contributions differ across types of galaxies?**

HD in nearby galaxies??

UCL-CHEM

X(HD)	N _H	T	c.r
5.3e-5	1000	50-100	1
6e-5	10 ⁴ -10 ⁵	50-100	1
6e-5	1000	50-100	10
7e-5	10 ⁴ -10 ⁵	50-100	10
1e-4	1000	50-100	100
2e-4	10 ⁴ -10 ⁵	50-100	100

If $X(\text{HD}) \sim 5 \times 10^{-5}$, $n(\text{H}_2) \sim 10^3 \text{ cm}^{-3}$ and source size 1pc
 $S_{\text{nu}}(\text{HD}) \sim 150 \text{ mJy}$ at 50 kpc

**HD detected with $S/N > 9$ in SMC/LMC
 in the worst case scenario**
